No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Whole spikes with awns trimmed were collected at 5, 10, 15, 20, 30 and 45 DAP (Fenton). Total RNA was prepared from each pool, equal quantities of all six RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       in vivo excised to give pBluescript SK(-) cDNA phagemids (Choi)in the TJ Close lab at the University of California, Riverside. Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    this clone see http://www.genome.clemson.edu/orders A. see Close TJ, Wing R, Kleinhofs A, Wise R (2001)

                                                                                                                                                                                                                                                                                                                                                                Seeds were surface sterilized then germinated under axenic conditions in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Five-day old seedling roots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and I million pfu were in vivo exclsed to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is the flowering locus T (FT) gene of Arabidopsis thaliana. FT regulates flowering in plants by modulating flowering time. Overexpression of FT results in early flowering, while loss of function mutations or antisense directed to FT causes late flowering. The FT polypeptide has a molecular weight of approximately 20kD, and is located on chromosome 1. The FT polypeptide is used in the invention to modulate flowering time in many mono and di-cotyledonous plants. The FT polypeptide is used for recombinant production of the polypeptide, and as a source of antisense, ribozyme or triplex forming sequences. The FT polypeptide can also be used to raise antibodies and to screen for modulators or cellular binding proteins. The methods of the invention allow for the production of crops at any time of year.

                 This is the flowering locus T (FT) gene antisense polynucleotide construct of the invention pSKIG60. FT regulates flowering in plants by modulating flowering time. Overexpression of FT results in early construct, while loss of function mutations or antisense directed to FT causes late flowering. The FT polypeptide has a molecular weight of approximately 20kb, and is located on chromosome 1. The FT polypeptide is used in the invention to modulate flowering time in many mono and call cotyledonous plants. The FT polynucleotide sequence is used for recombinant production of the polypeptide, and as a source of antisense, ribozyme or triplex forming sequences. The FT polypeptide can also be used to raise antibodies and to screen for modulators or cellular binding proteins. The methods of the invention allow for the production of crops cat any time of year.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Flowering

                                                                                                                                                                                                                                                                                                                                                                                                                                        the present invention describes a method to accelerate plant generatic and generation accelerated plants. The method uses a controlling gene functioning in the downstream of a gene under the control of solar radiation to accelerate plant generation using a gene functioning to accelerate the flowering time regardless of solar radiation. The metho can control flowering time to a desired period by shortening the juvenile stage. The present sequence represents a specifically claimed Arabidopsis nucleotide sequence, which is used in the exemplification of the present sequence, which is used in the exemplification of the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               solar radiation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   В
                                                                                                                                                                                                                                                                                                                                         A method plants -
                                                                  the present invention describes a method to accelerate plant generation and generation accelerated plants. The method uses a controlling gene functioning in the downstream of a gene under the control of solar radiation to accelerate plant generation using a gene functioning to accelerate the flowering time regardless of solar radiation. The method can control flowering time to a desired period by shortening the juvenile stage. The present sequence represents a specifically claimed Arabidopsis nucleotide sequence, which is used in the exemplification
                                                                                                                                                                                                                                                                                                                                       plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       11-NOV-1998;

These were identified using primers based on thomologous sequences from A. thaliana, B. napus and R. sativus. They can be used in the production of transgenic field crops whose flowering is regulated and the time of fruiting and harvesting can be maniful.

                                                                                                                                                                                                                                                                       expressed sequence tag, clone 1990777. A genomic till clone (AAT60142) has also been obtd. The wild-type role of the till gene is to inhibit flowering and to prevent the apical meristem from switching to a floral fate. The till gene was identified as a homologue of the Antirrhinum centraradialis gene (see also AAT60141). The flowering characteristics of transgenic plants, esp. switching of apical meristem to a floral fate and the timing of flowering, can be manipulated by regulating cen or till gene expression.
                                                                                                                                                                                                                                                                                                                                                          A cDNA clone (AAT60140) codes for t (AAW13945) of Arabidopsis thaliana.

                                                                                                                                                                       The present invention provides the nucleic acid and protein sequences a number of proteins from the strawberry which are involved in the regulation of flowering. These were identified using primers based on homologous sequences from A. thaliana, B. napus and R. sativus. They come used in the production of transgenic field crops whose flowering is regulated and the time of fruiting and harvesting can be manipulated.
                                                                                                                                                                                                                                                                                                                           useful for generating plants having altered day-neutral flowering
                                                                                                                                                                                                                                                                                                                                          Novel nucleic acid involved in controlling plant flowering processes useful for generating transgenic plants, in particular strawberry plants having altered flowering behavior such as early, delayed or

                                                                                                                                                                               CC Arabidopsis thaliana. It includes exons encoding an LSD1 color polypeptide (see AAW72366-67) that has an effect in regulating the CC polypeptide (see AAW72366-67) that has an effect in regulating the CC initial response of plants to pathogens and the subsequent spread CC of plant cell death engendered by infection. LSD1 functions to monitor levels of superoxide-dependent signal and negatively CC regulates a plant cell death pathway. To isolate the gene and CC LSD1 CDNA (see AAV66750-51), Arabidopsis mutants were obtained which ce exhibited constitutive cell death in the absence of pathogens. The CC lesion stimulating disease resistance or LSD phenotypes, which ce is in the complete to cell death, was then analysed by genetic cand physical complementation studes. The sequences obtained were CC plypeptides and isolated DNA sequences, a transformation vector, compared to databases. The invention provides LSD1 CC mutant genes that affect resistance to herbicidal compounds or CC plant pathogens that normally result in plant cell death. Also CC invention can be used to produce plants that show resistance to the colored the constitution can be used to produce plants that show resistance to the colored the colored the colored that show resistance to

                                                                               A cDNA clone (AAT60139) codes for the centroradialis (CEN) protein (AAW13944) of Antirhinum majus. It was obtd. from a cDNA library cyoung inflorescences by RT-PCR. A genomic cen gene sequence (AAT60141) was also obtd. The wild-type role of the cen gene is to prevent the apical meristem from switching to a floral fate. The flowering characteristics of transgenic plants, esp. switching of apical meristem to a floral fate and the timing of flowering, can be manipulated by regulating cen gene expression. The cen nucleic acids can also be used as probes to isolate homologous genes, e.g. the terminal flower1 (tfl1) gene (see also AAT60142) of Arabidopsis.
                                                                                                                                                                                                                                                                Antirrhinum majus centroradialis gene and Arabidopsis homologue, Tfll - control switching of apical meristem to floral fate, usef in plant hybridisation and in control of growing season
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CDS

P
  The present invention provides the nucleic acid and protein a number of proteins from the strawberry which are involved
                                                                                                                                   Novel nucleic acid involved in controlling plant flowering processes useful for generating transgenic plants, in particular strawberry plants having altered flowering behavior such as early, delayed or day-neutral flowering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Strawberry; harvesting;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   regulation of flowering. These were identified using primers based or homologous sequences from A. thaliana, B. napus and R. sativus. They be used in the production of transgenic field crops whose flowering i regulated and the time of fruiting and harvesting can be manipulated.

It was obtd. from a genomic library using Antirrhinum cen cDNA (see also AAT60139) as probe. A tfil cDNA clone (AAT60140) has also been obt. The wild-type role of tfil gene is to prevent the apical meristem from switching to a floral fate and to inhibit flowering. The flowering characteristics of transgenic plants, esp. switching of apical meristem to a floral fate and the timing of flowering, can be manipulated by regulating cen or tfil gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antirrhinum majus centroradialis gene and Arabidopsis homologue, Tfll - control switching of apical meristem to floral fate, usef in plant hybridisation and in control of growing season

The DNA sequence encodes the Onchocerca volvulus antigen (OV-16) which may be used in the diagnosis of onchocerciasis in an animal. Early and specific diagnosis of new or re-infections with O.volvulus in vector reinvasion areas, as well as the detection of light infections in areas where control is being attempted by widespread use of invermectin, is possible. This allows for monitoring, evaluating and consolidating onchocerciasis control by both the vector control and chemotherapeutic strategies.

(Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further information please visit the Derwent web site at www.derwent.com/dwpi/updates/ntis_us.html.)

 Direct Submission
Submitted (04-DEC-2001) Plant Gene Expression Center, 800 Buchand Street, Albany, CA 94710, USA
RIKEN Genomic Sciences Center (GSC) members carried out the collection and clustering of RAFL CDNAs (RAFL CDNA : 'RIKEN Arabidopsis Full-Length CDNA'); Seki,M., Narusska,M., Ishida,J., Satou,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai,J., Hayashizaki,Y. and Shinozaki,K.
 The Salk, Stanford, PGEC (SSP) Consortium members carried out the sequencing and annotation of the RAFL cDNAs: Yamada,K., Banh,J., Chang,C., Chang,E., Dale,J.M., Goldsmith,A.D., Lee,J.M., Onodera,C.S., Quach,H.L., Tang,C.C., Toriumi,M., Wu,H.C., Yamamura,Y., Yu,G., Yu,S., Bowser,L., Chen,H., Cheuk,R., Jones,T. Karlin-Neumann,G., Kim,C., Lam,B., Lin,J., Meyers,M.C., Miranda, Nguyen,M., Palm,C.J., Shinn,P., Southwick,A., Davis,R.W.,
 Yamada,K. (SSP/PGEC) and Seki,M. (RIKEN GSC) contributed this work. Shinozaki,K. (RIKEN GSC) and Theologis,A. (SS contributed equally to this work as PIS. Location/Qualifiers
 Ecker, J.R. and Theologis, A.
